# Common GUI functions

In waveSharp many controls have functionality that is not directly visible to the user. They often have been added to make changes to a setting easier/faster.

RESTORE DEFAULTS
On many pages you will see this symbol . Pressing this will bring a tool or a toolsection back into its default settings.

MOUSEWHEEL
WaveSharp uses a lot of spinners (numerical controls with up/down buttons) and sliders. Using the mousewheel you can change these settings faster and more accurately than by sliding/clicking the up/down buttons. For certain settings this is the preferred mode.

Using a mousewheel you have 4 modes.
      A) rotating the mousewheel without any button. This will change the setting as if you were clicking the up/down buttons
      B) with the SHIFT button down. The settings will change in steps 2x the default stepsize and will round the values.
      C) with the CTRL button down. The settings will change in steps 1/2x the default stepsize.
      D) with the CTRL+SHIFT button down. The settings will change in steps 1/4x the default stepsize.

MOUSE RIGHTCLICK
Many controls can be individually reset to the default settings by a rightclick of the mouse.
